

Tip of the Month – June 2002

Microsoft SQL Server Security Alert

You must have a password assigned to the System Administrator (SA) in your SQL server environment. Without a password, you are susceptible to increased virus attacks as well as unauthorized entry to your server.

There are a number of suggested settings, in addition to the password. For assistance or further information, please contact Laurie Larsen at x205, or visit the Microsoft Great Plains Web-site at <http://www.greatplains.com/>
